

Microsoft SharePoint for Public Websites

Design, Implementation and Enterprise Infrastructure Services

Background - Microsoft Office SharePoint Server 2007 (MOSS) is the enterprise member of Microsoft's SharePoint Products & Technologies which includes a variety of enterprise focused technologies aimed at the overall goal of managing your business information more effectively. With the latest SharePoint version Microsoft incorporated their Content Management Server (CMS) product into the SharePoint feature set creating a truly innovative engine for serving public facing website content. The market momentum behind this type of SharePoint implementation is growing daily and presents a compelling option for many companies.

Who else hosts their public facing site using SharePoint? Microsoft, Hawaiian Air and Viacom are just a few.

Why are companies choosing SharePoint? SharePoint is the information hub for business. Now you can use the same platform to host your public facing web website. The same SharePoint skills your end users adopt using SharePoint for collaboration and knowledge management can be transferred to your Marketing, PR or Investor Relations departments. Updating and modifying your website while maintaining workflow and approval mechanisms for all changes is already built into SharePoint and extends to this type of deployment.

Our Advantage - The team at SharePointHosting.com can help you transform your existing web sites into rich and compelling SharePoint-based experiences which reflect all the usability and search tuned standards (SEO) used throughout the industry today. We can also incorporate anything from e-commerce to rich media elements using Microsoft's SilverLight or Adobe's Flash to help your website stand out with a dynamic and compelling interface and overall positive user experience across any browser they might choose to use.

Our Process – We translate your existing designs into SharePoint compatible styles and layouts. Next we deploy this framework to the SharePoint environment we have built and configured to host your website. Creating or maintaining your content is all completed through a browser interface after this point by designated users. We also provide on-going support to help update layouts, designs or other graphical elements you may wish to develop further beyond your initial deployment. Our solutions scale to support workloads of several hundred visitors to tens of thousands visitors with many load balanced SharePoint servers.

Our Powerful Services - We leverage our core SharePoint implementation expertise to help with all aspects of your deployment including Software Licensing & Compliance, Data Center/Network, Security, Offsite Backup and DR while providing on-going technical support and solution lifecycle management you need.

- All licensing included
- No hardware to buy or maintain
- Predictable monthly cost

- SAS 70 Data Centers
- Offsite Backup & Disaster Recovery
- Onsite deployments available

1,000 corporate and government clients rely on our SharePoint infrastructure services. We are ready to help build your powerful SharePoint solution today. Call us at 302-824-7600 x 1 to speak with us about your requirements.
